Hiring Team
Sortitt

Re: Full Stack Engineer

Dear Sortitt hiring team,

Sortitt's Full-Stack Engineer role centers on building scalable web applications with React and Node.js. That is the core of what I do. I re-architected a legacy monolith into a multi-tenant SaaS platform using **Node.js and MongoDB**, serving 10 isolated enterprise tenants with React frontends, enterprise SSO via JWT, and a **20% throughput improvement** alongside 40% faster login times. I also built a real-time notification service on PostgreSQL with WebSockets delivering alerts to 1,000+ users within 20 seconds.

On the frontend, I have shipped React UIs across multiple production systems, including a Jest-tested rich-text editor reused across 7 products and a real-time messaging platform for 1,000+ users. I work in **TypeScript** and follow standard practices around Git, CI/CD pipelines, and code review. My backend work spans RESTful API design, event-driven architecture, and database work in both MongoDB and PostgreSQL. I am comfortable with the full delivery loop from architecture decisions through production deployment on cloud infrastructure.

Sortitt's model of connecting businesses with on-demand resources across the globe resonates with how I approach engineering: building systems that scale across diverse use cases without sacrificing reliability. I work remotely and am based in India, which aligns with the role's remote setup. I would welcome the chance to discuss how my full-stack and AI infrastructure experience can contribute to Sortitt's platform.

Sincerely,
Rohit Verma
